

## ***MCR QUALITY REVIEW PROCESS***

MCR's quality review process (QRP) consists of a network of well-defined activities intended to ensure a high degree of confidence that our products meet the needs of our internal "customers" and reflect well upon the organization in the larger Intelligence Community (IC).

Having an effective QRP in place will benefit our organization, our internal customers, and our own people. Benefits of QRP to MCR as a organization include the following: (1) a standard operating procedure for developing products of the highest quality; (2) a standard format for delivering our products to customers and communicating to them exactly what we have done and why it is the right thing to do; and (3) an enhanced reputation in the larger cost community for the quality of our analysis and recommendations.

MCR's having an effective QRP in place also benefits our customers in ways that they will be able to understand. First of all, methodology errors will be detected and corrected before extensive computational work is done, and computational errors will be detected well in advance of the final product's being submitted to the decision maker. The customer will be confident in knowing that MCR's products are developed using state-of-the-art analytic methods that enjoy wide support in the cost-analysis community. MCR's methods will be fully justified and documented with appropriate references to accepted analysis techniques, historical data and other related experience, so our customers can carry our work up their management chains, knowing that the work will be fully understandable, supportable, and accepted.
